load terminals is not more than 10 percent.

- (c) Cable and wiring not serving equipment in high risk fire areas such as a galley, laundry, or machinery space must be routed as far as practicable from these spaces. As far as practicable, cables serving duplicated essential equipment must be separated so that a casualty that affects one cable does not affect the other. Existing cables and wires may remain as routed; however, any replacement wiring, new cabling and/or alterations must be routed as specified above.
- (d) No unused or dead ended cables may remain after the permanent removal or alteration of an electrical device.
- (e) Cable and wire for power and lighting circuits must:
- (1) For circuits of less than 50 volts, meet 33 CFR 183.425 and 183.430; and
- (2) For circuits of 50 volts or greater:
- (i) Meet section 310-13 and 310-15 of NFPA 70, except that asbestos insulated cable and dry location cable must not be used:
- (ii) Be listed by Underwriters Laboratories Inc. as UL Marine Boat or UL Marine Shipboard cable; or
 - (iii) Meet §111.60 of this chapter.
- (f) All metallic cable armor must be electrically continuous and grounded to the metal hull or the common ground point at each end of the cable run, except that final sub-circuits (those supplying loads) may be grounded at the supply end only.
- (g) Wiring terminations and connections must be made in a fire retardant enclosure such as a junction box, fixture enclosure, or panel enclosure.
- (h) Existing cable and wire may remain in place and continue in use as long as it is deemed serviceable to the satisfaction of the Coast Guard Representative. Any new installation, replacement, modification or alteration must be done in accordance with the requirements of this section.

§ 28.870 Emergency source of electrical power.

(a) The following electrical loads must be connected to an independent emergency source of power capable of supplying all connected loads continuously for at least three hours:

- (1) Navigation lights;
- (2) Fire protection and detection systems;
 - (3) Communications equipment;
 - (4) General alarm system; and
 - (5) Emergency lighting;
- (b) The emergency power source must be aft of the collision bulkhead, outside of the machinery space, and above the uppermost continuous deck.
- (c) An emergency source of power supplied solely by storage battery must also meet the following requirements:
- (1) Each battery must be a lead-acid or alkaline type and be able to withstand vessel pitch, vibration, roll, and exposure to a salt water atmosphere;
- (2) A battery cell must not spill electrolyte when the battery is inclined at 30 degrees from the vertical;
- (3) Each battery installation must be in a battery room, in a box on dock, or in a well ventilated compartment. The batteries must be protected from falling objects;
- (4) Each battery tray must be secured to prevent shifting with the roll and pitch of the vessel and lined with a material that is corrosion resistant to the electrolyte of the battery;
- (5) Each battery bank installation must be fitted with its own drip-proof charging system; and
- (6) Each deck box used for battery storage must be weathertight, and have holes near the top to allow gas to escape.

§28.875 Radar, depth sounding, and auto-pilot.

- (a) Each vessel must be fitted with a general marine radar system for surface navigation with a radar screen mounted at the operating station, and facilities on the bridge for plotting radar readings.
- (b) Each vessel must be fitted with a suitable echo depth sounding device.
- (c) Except as provided in 33 CFR §164.15, when the automatic pilot is used in areas of high traffic density, conditions of restricted visibility, and all other hazardous navigational situations, the master or person in charge shall ensure that:
- (1) It is possible to immediately establish manual control of the unit's steering:

§ 28.880

- (2) A competent person is ready at all times to take over steering control; and
- (3) The changeover from automatic to manual steering and vice versa is made by, or under the supervision of, the officer of the watch.

§28.880 Hydraulic equipment.

- (a) Each hydraulic system must be so designed and installed that proper operation of the system is not affected by back pressure in the system.
- (b) Piping and piping components must be designed with a burst pressure of not less than four times the system's maximum operating pressure.
- (c) Each hydraulic system must be equipped with at least one pressure relieving device set to relieve at the system's maximum operating pressure.
- (d) All material in a hydraulic system must be suitable for use with the hydraulic fluid used and must be of such chemical and physical properties as to remain ductile at the lowest operating temperature likely to be encountered by the vessel.
- (e) Except for hydraulic steering equipment, controls for operating hydraulic equipment must be located where the operator has an unobstructed view of the controls for operating hydraulic equipment and the adjacent work area. Protection shall be afforded to the operator of hydraulic equipment against falling or swinging objects and/or cargo.
- (f) Controls for hydraulic equipment must be so arranged that the operator is able to quickly disengage the equipment in an emergency.
- (g) Hydraulically operated machinery must be fail-safe or equipped with a holding device to prevent uncontrolled movement or sudden loss of control due to loss of hydraulic system pressure. A system is considered to be fail-safe if a component failure results in a slow and controlled release of the load so as not to endanger personnel.
- (h) Nonmetallic flexible hose assemblies must only be used between two points of relative motion, limited to the least amount of length that will afford maximum multidirectional movement of the equipment served.
- (i) Hose end fittings must comply with SAE J1475, (Hydraulic Hose Fit-

tings For Marine Applications). Field attachable fittings must be installed following the manufacturer's recommended practice (method).

- (j) Nonmetallic flexible hose shall be marked with the manufacturer's name or trademark, type or catalog number and maximum allowable working pres-
- (k) Existing hydraulic piping, nonmetallic hose assemblies, and components may be continued in service so long as they are maintained in good condition to the satisfaction of the Coast Guard Representative, but all new installations, or replacements shall meet the applicable specifications or requirements of this section.

§28.885 Cargo gear.

- (a) The safe working load (SWL) for the assembled gear shall be marked on the heel of each cargo boom, crane, or derrick. These letters and figures are to be in contrasting colors to the background and at least one inch in height. The SWL is construed to be the load the gear is approved to lift, excluding the weight of the gear itself.
- (b) All wire rope, chains, rings, hooks, links, shackles, swivels, blocks, and any other loose gear used or intended to be used in cargo loading or unloading must be commensurable with the SWL rating in paragraph (a) of this section. This gear shall be visually inspected by the vessel's captain or his designee at frequent intervals, and in any event not less than once in each operating month.
- (c) In addition to the inspection required in paragraph (b) of this section, a biennial, (every second year), thorough examination and proof load test, at a minimum of the SWL rating, shall be performed and witnessed by competent personnel. The proof load applied to the winches, booms, derricks, cranes and all associated gear shall be lifted with the ship's normal tackle with the boom or derrick at the lowest practicable angle. When the load has been lifted, it shall be swung as far as possible in both directions.
- (d) After satisfactory completion of the tests and examinations required in paragraphs (b) and (c) of this section, all results and notations together with the date and location of each shall be
